Experiment 2 : Implement Multiple Regression, Lasso, and Ridge Regression on Real-World Datasets

1. Dataset Source

- Dataset Name: Bank8FM Dataset
- Source: Hugging Face
- Link: https://huggingface.co/datasets/yzhuang/metatree_bank8FM

2. Dataset Description

The Bank8FM dataset is a real-world dataset used for regression tasks, where the objective is to predict a continuous target variable based on multiple input features.

- **Number of Instances:** ~8,192
- **Number of Features:** 8 input features + 1 target variable

Features:

- The dataset consists of 8 numerical input features (X1 to X8) representing various attributes

Target Variable:

- A continuous numerical value representing the output variable

Dataset Characteristics:

- Fully numerical dataset
- No categorical variables
- Suitable for regression analysis
- No major missing values
- Moderate dataset size

3. Mathematical Formulation of the Algorithm

Multiple Linear Regression

Multiple Linear Regression models the relationship between dependent and independent variables:

$$y = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \cdots + \beta_n x_n + \epsilon$$

Ridge Regression (L2 Regularization)

$$\min \left(\sum (y_i - \hat{y}_i)^2 + \lambda \sum \beta_j^2 \right)$$

- Penalizes large coefficients using L2 norm

Lasso Regression (L1 Regularization)

$$\min \left(\sum (y_i - \hat{y}_i)^2 + \lambda \sum |\beta_j| \right)$$

- Performs feature selection by shrinking coefficients to zero

4. Algorithm Limitations

Multiple Regression:

1. Sensitive to multicollinearity
2. Assumes linear relationship
3. Affected by outliers

Ridge Regression:

1. Does not perform feature selection
2. Requires tuning of regularization parameter

Lasso Regression:

1. Can eliminate important features
2. Unstable when features are highly correlated

5. Methodology / Workflow

Steps Involved

1. Import required libraries
2. Load dataset from Hugging Face (Bank8FM dataset)
3. Perform data preprocessing (checking missing values, normalization if required)
4. Split dataset into training and testing sets
5. Apply feature scaling using StandardScaler
6. Train initial Multiple Linear Regression model
7. Train initial Ridge and Lasso regression models
8. Define hyperparameter grid (alpha values for Ridge and Lasso)
9. Perform GridSearchCV for tuning
10. Retrieve best parameters
11. Train final optimized models
12. Evaluate model performance using regression metrics
13. Generate predictions

6. Performance Analysis

Evaluation Metrics Used:

- Mean Absolute Error (MAE)
- Mean Squared Error (MSE)
- Root Mean Squared Error (RMSE)
- R^2 Score

Interpretation:

- **MAE:** Average magnitude of errors
- **MSE:** Penalizes larger errors
- **RMSE:** Square root of MSE for better interpretability
- **R^2 Score:** Proportion of variance explained by model

Observations:

- Multiple Regression provides baseline performance
- Ridge Regression reduces overfitting
- Lasso Regression performs feature selection
- Regularization improves generalization

7. Hyperparameter Tuning

Parameters Tuned:

Ridge & Lasso:

- Alpha (regularization strength)

Method Used:

- GridSearchCV

Process:

- Tested multiple alpha values
- Used cross-validation
- Selected best alpha based on performance metrics

Best Parameters:

- Optimal alpha values selected for Ridge and Lasso

Impact on Performance:

- Reduced overfitting
- Improved prediction accuracy
- Better model generalization

8. Conclusion

In this experiment, Multiple Linear Regression, Ridge, and Lasso were implemented on the Bank8FM dataset. Regularization techniques improved model performance by reducing overfitting. Ridge helped stabilize coefficients, while Lasso enabled feature selection. Overall, regularized models provided better generalization compared to standard regression.
